

PRODUCT INNOVATIONS

Watertanks

Watersilo's

Watersilo's

PREFABtank storage systems are made of galvanised, corrugated steel panels. The well-conceived design has many practical advantages. The corrugation (76 x 18 mm) creates strength and rigidity even with thinner panels, allowing the construction of water tanks with diameters up to 31 metres and wall thicknesses of 0.8 - 2.0 mm. The tank panels are jointed by means of bolts, nuts and washers. Because of its light weight and the simple bolt connections, the **PREFABtank** storage system can be easily installed by two to four people; no special hoisting systems or tools are needed.

Special coating

In addition to the standard galvanised version, the tank panels can also be provided with an extra protective coating, the duplex pre-coat system. Preserving the zinc layer protects against corrosion and considerably extends the material's lifetime.

Tank base (foundation)

Depending on the soil stability, the tanks can simply be placed on a sand bed, sunk into the ground surface (to at least 40 cm). On less stable or rocky soil, a simple concrete floor or concrete ring can serve as a foundation.

Tank liners

A plastic liner (membrane) on the inside of the steel tank provides complete water tightness. Tank liners are available in different materials, such as PVC, Polyolefin or EPDM. The use of a liner renders the PREFABtank suitable for storage of almost any kind of liquid.

Tank covers

Various solutions have been developed to cover the silo. The choice of the right cover depends on the tank diameter, the application and the climate conditions.

Properties

- lightweight, strong design;
- rapid and simple assembly without special assembly or hoisting tools;
- no special requirements for the foundation;
- wide variety of applications
- suitable for storage of almost any kind of liquid;
- easy to transport around the globe using trucks or containers;
- competitive compared to concrete or steel silos or regional options;
- can be sealed with silo caps and covers.

PREFABtank storage systems are available as:

1 Tank storage system without cover

This simple solution can be used if water contamination is not an issue. Available in diameters from 1.8 to 31.0 metres and heights varying from 1.52 to 4.64 metres, depending on the diameter.

2 Tank storage system with span (tensioned) roofing

The span roof offers a good solution if there are specific tank cover requirements (anti-algae). Available in diameters from 3.64 to 20.94 metres. The tank is reinforced with panels with a larger wall thickness.

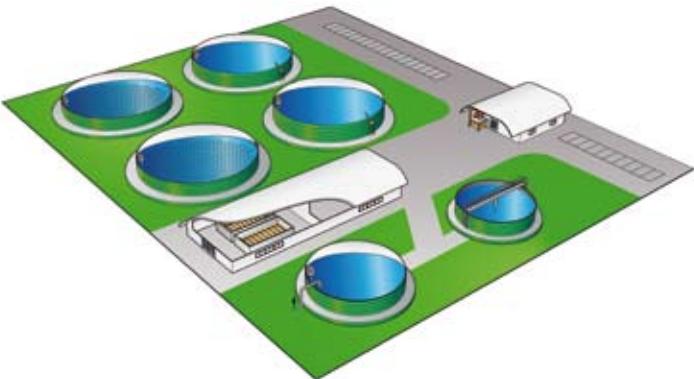

3 Storage system with steel roof

The steel roof offers additional guarantees for applications that have to meet higher requirements in terms of lifecycle, UV resistance or professional appearance. Available in diameters from 3.64 to 14.57 metres.

4 Storage system with air-pressed tank roof

The perfect system to completely seal larger silos – simple and efficient. The tank liner and the roof together form an airtight construction. A small fan (U=230V, P=250 Watts) keeps the system under pressure. A set of tubes on the top of the tank wall absorbs the forces of the roof. This system requires a concrete floor and our consultant's assistance during installation. Available in diameters from 3.64 to 26.40 meter.

Special applications

The innovative details and well-conceived design make the PREFABtank suitable for use in numerous applications, such as the storage of waste water, manure / sludge, distilled water, drinking (potable) water and other liquids. The tank systems are also used for aerobic and anaerobic systems (aeration), complete purification systems and the storage of cereals, seeds and granules.

Standard solutions are available for the installation of pumps and mixers in our tank systems.
